

Raising Standards. Protecting Homeowners

External Walls Seminar Working together to get it right

Welcome and introduction

"The penetration of water into the fabric of a building has serious consequences for the health of the occupants and for the long term serviceability of the structure... By their nature, masonry walls are not waterproof." BS 5628: Part 3: 2001, section 5.5

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Agenda

- Claims statistics
- Areas of concern
 - Cavity trays and DPC's
 - Insulation
 - Render
 - Structure
- Managing out the problem

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

After this presentation you should

- Know what the common defects are
- Understand their root cause
- Be clear on the consequences
- Be better equipped to get it right first time

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

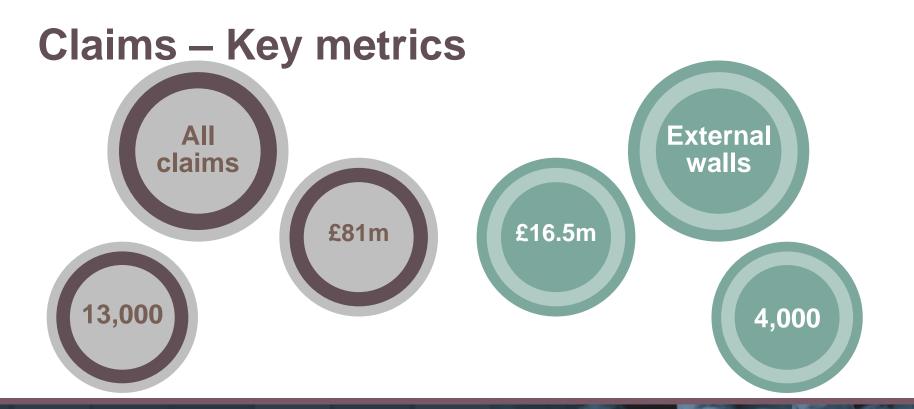

Claims statistics

- Areas of concern
 - Cavity trays and DPC's
 - Insulation
 - Render
 - Structure
- Managing out the problem

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Claims - External Walls

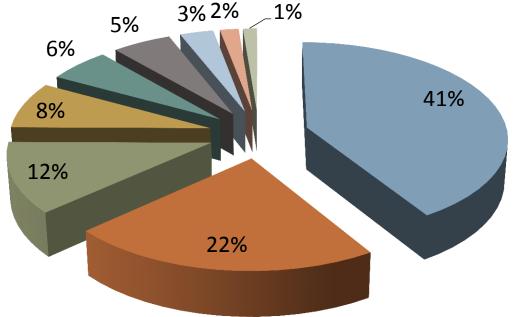

- Cavity trays & DPC's
- Insulation
- Render
- Structure

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

Claim statistics – Cavity trays & DPC's

Cavity tray incorrect position

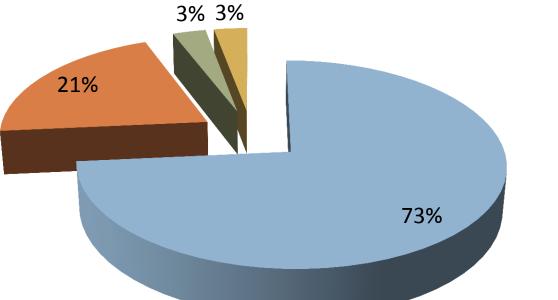

- Cavity tray missing
- Cavity tray inadequate joins
- Cavity tray incorrect end detail
- Cavity tray incorrect type
- Vertical/horizontal dpc incorrect position
- Vertical/horizontal dpc missing
- Cavity tray no weep vents
- Vertical/horizontal dpc incorrect type

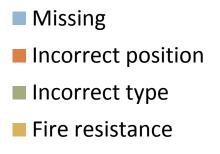

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Claim statistics – Insulation

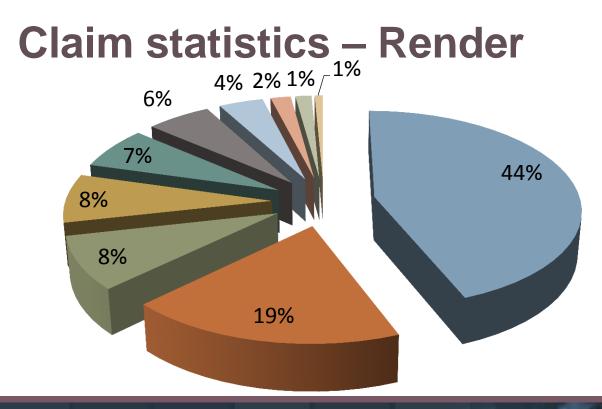

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

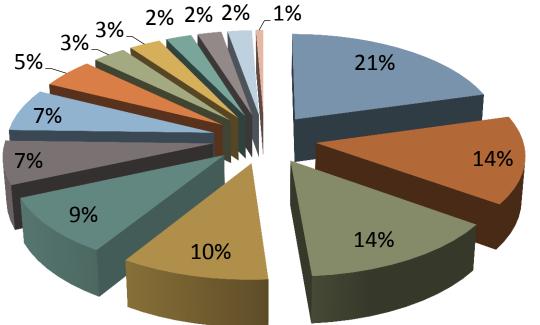

- Debonding from substrate
- Coats or thickness
- Shrinkage in substrate
- Render shrinkage
- Perimeter details
- Mix strength
- Laths and reinforcement
- Timber abutments
- Frost damage
- Sulfate attack

NHBC External Walls Seminar

Claim statistics – Structure

- Parapets/copings inadequately fixed
- Bridged cavity
- Poor pointing
- Mortar
- Bonding irregular/inadequate
- Unfilled joints
- Cladding to timber frame
 - Movement joints missing/incorrect position
- Lintels
- Not plumb/level
- Frost damage
- Appearance
- Thermal movement/shrinkage
- Wall ties

NHBC External Walls Seminar

The customer experience - Claims

NHBC External Walls Seminar

The customer experience - Claims

NHBC External Walls Seminar

Claims statistics

Areas of concern

Cavity trays and DPC's

- Insulation
- Render
- Structure
- Managing out the problem

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Do horizontal cavity trays need stop ends?

- a) Yes
- b) No

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

Do horizontal cavity trays need stop ends?

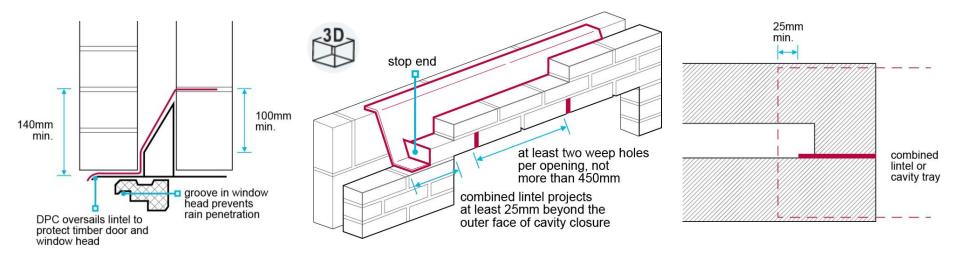

- a) Yes
- b) No

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

Horizontal trays - Good practice

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Correct spacing and number of weep holes. Shame about location

Is there a cavity tray at this height?

Weep holes installed, but at the wrong height

Vent gone through tray??

Is there a cavity tray at this height?

Cavity tray cut short - at least 25mm past closer or to cover the lintel (whichever is greater)

No stop end

Weeps wrong place

Is there a cavity tray at this height?

Is this stop end satisfactory?

Full of mortar. Weep blocked if there is one

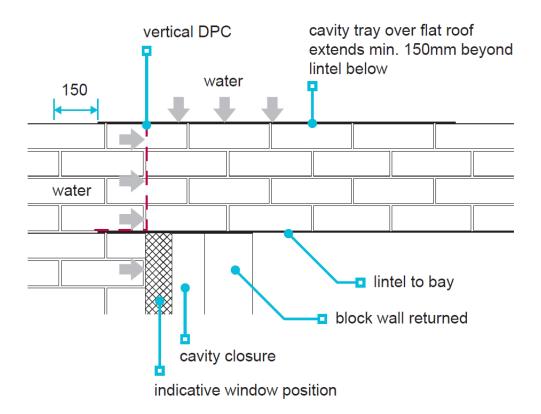

Missing weep holes

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Where is the reveal? Looks to be inside

No VDPC

Stepped cavity trays

Factors to consider when installing stepped cavity trays?

- Roof pitch
- Roof build-up
- Profile of tile/slate
- Tray material
- Wall plate height

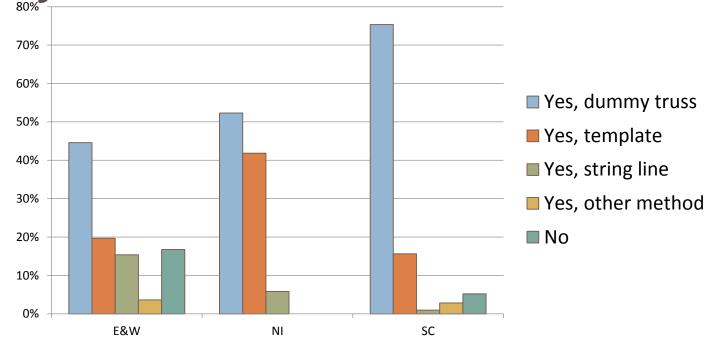

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Survey results - Profiles

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Raising Standards. Protecting Homeowners

No. No. No. No.

Good coordination and pre-planning

OH

Weeps here. Tray too high?

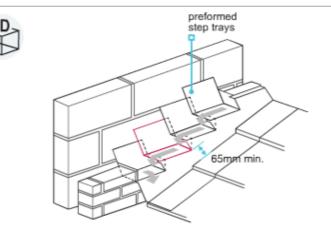

No sign of broken bond. Indicates missing or incorrectly located trays/stop ends

Stepped cavity trays

Where the roof abuts at an angle with the wall, preformed stepped cavity trays should be provided.

To minimise the risk of water ingress below the abutment, preformed stepped cavity trays:

- should be provided where a roof abuts a cavity wall above an enclosed area, e.g. an attached garage
- should have two stop ends at the lowest cavity tray and a weep hole to allow water to drain from the cavity
- are not necessary where the roof is not over an enclosed area, e.g. open car ports and open porches.

Preformed stepped cavity trays should be installed in accordance with the manufacturer's recommendations and positioned:

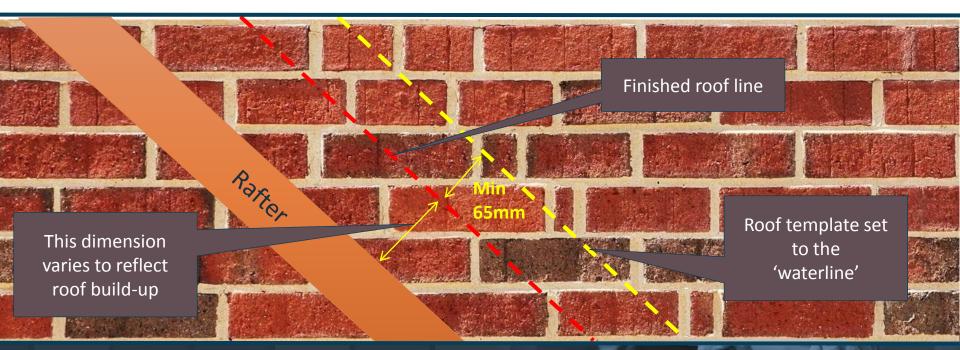

- to suit the dimension of the flashing (which should be in accordance with the manufacturer's recommendations or a minimum width of 65mm)
- so that the stepped cavity tray cannot discharge behind flashing (where it is necessary to cut bricks or blocks, the bond should be maintained in the following joint).

Increasing industry awareness of defects of external walls

Stepped cavity trays - Flexible

'Getting it right first time'

Soakers/secret gutter omitted for clarity

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Brick dust would suggest grinding

Is there a tray?

IE

No sign of a weep hole?

Trays discharge into roof space

Trays not stop ended

No trays here

Joints ground out

No weep

The state of the

Broken bond to follow pitch line

Pull-off strip for flashing

LEAD

Par

Broken bond to follow pitch line

Pull-off strip for flashing

LEAD

Par

Should lead flashing sit under or on top of cavity trays?

- a) Under
- b) Above

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Should lead flashing sit under or on top of cavity trays?

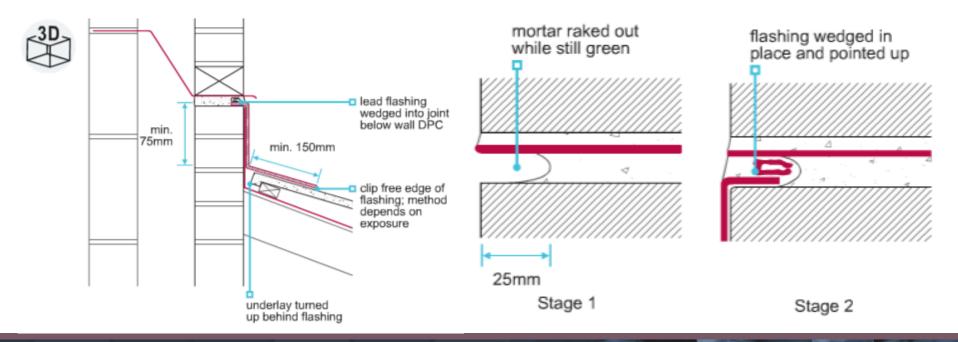

- a) Under
- b) Above

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Connections with flashings

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Flashing built in the correct place

Tray and weep hole too low

VDPC required

Timber in direct contact with brickwork

Weep hole blocked

Bed joint not raked out

Flashing ground into joint

No tray installed

Flashing not to correct depth

No stop end or weep hole

Flashing installed above the tray

Flashing installed above the tray

Flexible DPC installed wrong

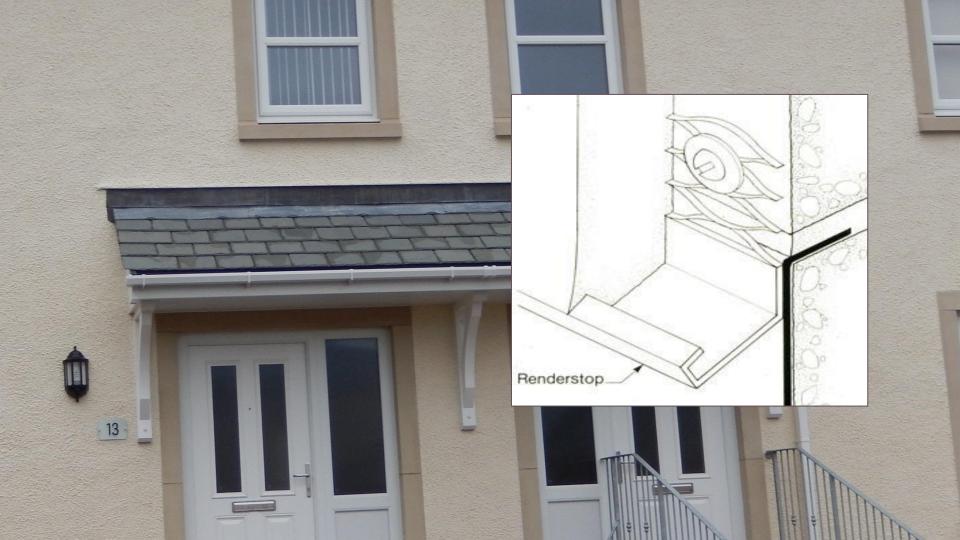

Joint ground out

Tray in the right place but now ruined

No weep holes

Brick dust = grinding of joint

When fitting cavity trays to rendered properties, weep holes are required:

- a) At no more than 900mm centres and minimum 2 per opening
- b) At no more than 450mm centres
- c) Only at the bottom of stepped trays.
- d) Not required

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

When fitting cavity trays to rendered properties, weep holes are required:

- a) At no more than 900mm centres and minimum 2 per opening
- b) At no more than 450mm centres
- c) Only at the bottom of stepped trays.
- d) Not required

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Weeps above door opening not required

How is the flashing linked to the stepped tray?

No weep hole at bottom of stepped tray

Claims statistics

Areas of concern

- Cavity trays and DPC's
- Insulation
- Render
- Structure
- Managing out the problem

NHBC External Walls Seminar

Good practice

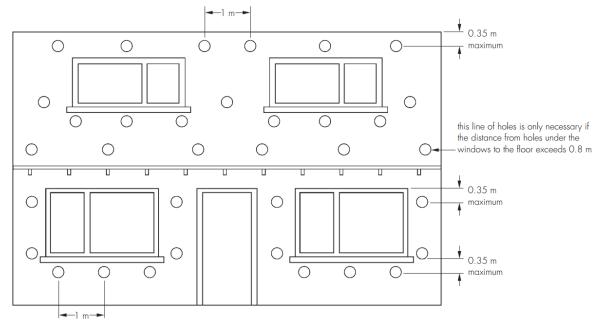

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Retro filling cavities

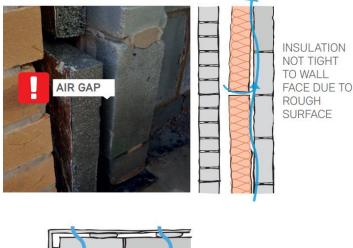

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Things to avoid

GAPS BETWEEN ADJACENT BOARDS = HEAT LOSS

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Missing insulation creates cold spots

Cavity closer too narrow to close cavity

Poorly cut insulation around window former

Mortar not struck off

Insulation missing from below lintel

Under-filled Insulation

The second second

Cavities must be closed for fire at window openings (AD B3 <u>6.3</u>)

Very short cavity closer

Mortar across insulation joints

Not tight to internal leaf

Heat loss issue

Claims statistics

Areas of concern

- Cavity trays and DPC's
- Insulation
- Render
- Structure
- Managing out the problem

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

The most common causes of cracking in render are

- Blockwork porosity / strength / mixing materials
- Lack of movement joints/reinforcement
- Incorrect application and curing
- Incorrect render mix
- Protection of work

NHBC External Walls Seminar

Table 10: Spacing of wall ties

	Maximum horizontal spacing (mm)	Maximum vertical spacing (mm)
General wall area	900	450
Jamb openings, movement joints, etc.	Within 225 of opening	Not more than 300 ⁽¹⁾
Top of gable walls	225 (parallel to the top of the wall)	Not more than 300

Notes

1 The cavity insulation may need cutting to insert the tie.

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Brick movement joints do not continue through feature stone

and the second second

Toothed brickwork and blockwork!

If we wanted to be picky, open joint here

The second second

50mm embedment?

6080608

la la faga la la

Tell-tale slot confirms ties installed after laying.

Gauging out

Ties too long and sloping inwards

Cavity width?

Wall tie not bedded 50mm to blockwork

Back of frog broken off to keep gauge

Three key reasons why lintels should be fully bedded on mortar?

- To ensure it is level
- To spread the load evenly
- Prevent passage of moisture

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Lintel dry bedded

Daylight on this one!

Not just lintels, no packing to steel beam

Which three are the most commonly recorded RI's for external walls?

- a) Remove mortar debris from cavities
- b) Inadequate fire stopping
- c) Joints not fully filled
- d) Excessive depths of service chases
- e) Incorrect cavity tray installation

NHBC External Walls Seminar

Managing out the problem

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

Quality doesn't happen by accident!

You get what you inspect not what you expect

NHBC External Walls Seminar

Increasing industry awareness of defects of external walls

Raising Standards. Protecting Homeowners

How can we support you? We're in this together!

- Trade Talks
- Benchmark & Consultative inspections
- Increased site time e.g. Pre-start meetings
 - Risk Guides
- Further Site Manager training (including OnSite)
- Enhanced technical guidance
 - New Standards with 3D models

NHBC External Walls Seminar

Key messages to take away

- In this together
- Workmanship
- Site Manager can make the difference
- Get it right first time
- You get what you inspect, not what you expect

Raising Standards. Protecting Homeowners

NHBC External Walls Seminar

A final thought....

Its all about Teamwork
